Procenttabellen.

Einer Anregung des Herrn Geheimrath Prof. BEILSTEIN zufolge ist die in der ersten Auflage befindliche, damals nur die Kohlenwasserstoffe umfassende Procent-tabelle auf die Formen **CHO**, **CHN** und **CHON** ausgedehnt worden.

Sollte es sich als wünschenswerth oder nothwendig herausstellen, auch für weitere Formen, z. B. **CHCl**, **CHBr**, **CHONS** u. s. f., solche Ausrechnungen zu besitzen, so möge diese, die Kräfte des Einzelnen übersteigende, rein mechanische Arbeit jüngeren Fachgenossen vorbehalten bleiben, — waren doch schon allein 90,000 Einzelrechnungen zur Ausführung obiger Arbeit erforderlich. Zunächst wird das gesammelte Zahlenmaterial vollauf genügen, und zwar nicht nur für obige Formen selbst, sondern auch für solche, welche andere Elemente enthalten.

Einige Beispiele werden diese Thatsache veranschaulichen.

Die Relation $O_2:S = 32:32$ zeigt, dass die Tafeln der **CHO**- und **CHON**-Formen ohne Weiteres auch für die **CHS**- und **CHNS**-Verbindungen benutzbar sind, indem an Stelle von zwei Atomen Sauerstoff ein Atom Schwefel gesetzt wird. So besitzen beispielsweise gleiches Molekulargewicht und Zusammensetzung die Verbindungen:

On Prof. BEILSTEIN's suggestion the table of percentages which in the first edition only comprised the hydrocarbons has been extended to the forms **CHO**, **CHN** and **CHON**.

Were it desirable or necessary to possess such calculations for other forms, e. g. **CHCl**, **CHBr**, **CHONS** etc., this purely mechanical task, which is beyond the power of a single man, must be reserved for younger men, since 90,000 independent calculations had to be made to accomplish the above task. For the present the collected numerical material will fully suffice not only for the above forms, but also for those containing other elements.

Some examples will illustrate this fact.

The relation $O_2:S = 32:32$ indicates that the tables of the **CHO**- and **CHON**-forms can also be used for the compounds of the forms **CHS** and **CHNS** by substituting one atom of sulphur for two atoms of oxygen. Thus for example the following compounds possess equal molecular weights;

Suivant le désir de M^r le Prof^r BEILSTEIN, les tables de la composition centésimale qui, dans la 1^{re} édition de cet ouvrage, ne comprenaient que les hydrocarbures, ont été étendues aux formes **CHO**, **CHN** et **CHON**.

Si le besoin se faisait sentir de l'adopter à de nouveaux types tels que **CHCl**, **CHBr**, **CHONS**, l'activité d'un homme serait alors insuffisante, car l'exécution du travail supplémentaire auquel j'ai dû me livrer, a exigé à lui seul plus de 90,000 calculs. Ce travail purement mécanique, doit être réservé à des collègues plus jeunes. Le matériel numérique peut en tous cas suffire actuellement non seulement pour les formes mentionnées, mais aussi pour celles qui renferment d'autres éléments.

Quelques exemples éclairciront la question:

La relation $O_2 : S = 32 : 32$ montre que les tables correspondant aux types **CHO** et **CHON**, peuvent également servir pour **CHS** et **CHNS** en remplaçant deux atomes d'oxygène par un atome de soufre. Ainsi les combinaisons suivantes ont le même poids moléculaire et les mêmes compositions:

Per consiglio dell' illustre Prof. BEILSTEIN, venne estesa la tabella delle composizioni centesimali, che nella prima edizione comprendeva solo gli idrocarburi, anche alle forme **CHO**, **CHN** e **CHON**.

Ove dovesse sembrare desiderabile o necessario il possedere tali calcoli, anche per altre forme, quali **CHCl**, **CHBr**, **CHONS**, il lavoro occorrente, puramente meccanico, ma tale da superare la potenzialità di un solo individuo, viene lasciato a colleghi più giovani. Già per la compilazione, delle tabelle percentuali contenute in quest'opera si richiesero circa 90,000 singole operazioni. Del resto i valori numerici qui raccolti saranno sufficienti non solo per le forme stesse per cui furono calcolati; ma anche per altre contenenti elementi diversi.

Alcuni esempi faranno comprendere questo fatto.

La relazione $O_2 : S = 32 : 32$ mostra che le tavole delle forme **CHO** e **CHON** si possono senz'altro adoperare anche per le forme **CHS** e **CHNS**, sostituendo al posto di due atomi d'ossigeno uno di solfo. Così p. es. posseggono un ugual peso molecolare, ed un' identica composizione centesimale i composti:

Aus dieser Darlegung wird nunmehr auch ersichtlich, warum in den Procenttabellen auch die auf den ersten Blick überflüssig erscheinenden Sauerstoffprocente wiedergegeben sind — es war dies im Interesse der Schwefelverbindungen nothwendig.

Aber auch die procentuale Zusammensetzung der Formeln **CHONS** ist man im Stande, aus den Formeln **CHON** mittelst einer kleinen Rechnung, nämlich durch Theilung der Sauerstoffprocente nach Verhältniss, leicht zu erfahren, z. B. Verhältniss **O : S** = 1 : 1

$C_{10}H_{12}O_4N_2$	$C_{10}H_{12}O_2N_2S$
C_{10} 53,6 $\frac{0}{0}$	C_{10} 53,6 $\frac{0}{0}$
H_{12} 5,3 $\frac{0}{0}$	H_{12} 5,3 $\frac{0}{0}$
O_4 28,6 $\frac{0}{0}$	O_2 14,3 $\frac{0}{0}$
N_2 12,5 $\frac{0}{0}$	N_2 12,5 $\frac{0}{0}$
	S 14,3 $\frac{0}{0}$
100,0 $\frac{0}{0}$	100,0 $\frac{0}{0}$

oder Verhältniss **O : S** = 3 : 2

$C_6H_6O_3N_2$	$C_6H_6O_3N_2S$
C_6 38,7 $\frac{0}{0}$	C_6 38,7 $\frac{0}{0}$
H_6 3,2 $\frac{0}{0}$	H_6 3,2 $\frac{0}{0}$
O_3 43,0 $\frac{0}{0}$	O_3 25,8 $\frac{0}{0}$

	S 17,2 $\frac{0}{0}$
100,0 $\frac{0}{0}$	100,0 $\frac{0}{0}$

In gleichem Sinne können für **Cl**, **Br**, **J** u. s. f. enthaltende Formeln die Tafeln der **CHO**- und **CHN**-Formen benutzt werden, wenn es sich um annähernde Werthe handelt. Es verhalten sich nämlich:

$O_5 : Br$	= 80 : 80
$O_5 : Se$	= 80 : 79
$O_8 : J$	= 128 : 127
$N_5 : Cl_2$	= 70 : 71

und entsprechen sich in ihrer procentualen Zusammensetzung die Verbindungen:

C_5H_9Br	wie $C_5H_8O_5$
$C_8H_{10}Se$	„ $C_8H_{10}O_5$
$C_{10}H_{15}J$	„ $C_{10}H_{14}O_8$
$C_{12}H_{20}Cl_2$	„ $C_{12}H_{21}N_5$

allerdings nicht genau, zumeist aber nur mit einer bei Analysenzahlen selbstver-

These remarks indicate why in the tables the percentages of oxygen are given which on first sight would seem to be superfluous; this was necessary for the sake of the sulphur compounds.

But also the percentage compositions of the formulae **CHONS** many readily be derived from the formulae **CHON** by means of a simple calculation, namely by proportionally dividing the percentages of oxygen, viz. the ratio **O : S** = 1 : 1

Similarly for the compounds containing **Cl**, **Br**, **J** etc. the tables of the **CHO**- and **CHN**-forms can be used if approximate values suffice. For the following relations exist:

and the following compounds agree in their percentage composition:

The agreement is not close, but in most cases lies within the limits of ex-

C'est donc dans l'interet des corps souffrés que les quantités centésimales d'oxygène ont été maintenues dans les tables.

On pourra aussi, par une simple division de la quantité d'oxygène, calculer la forme **CHONS** au moyen de **CHON**. Par exemple avec le rapport **O : S = 1 : 1**

$C_{10}H_{12}O_4N_2$	$C_{10}H_{12}O_2N_2S$
C_{10} 53,6 $\frac{0}{0}$	C_{10} 53,6 $\frac{0}{0}$
H_{12} 5,3 $\frac{0}{0}$	H_{12} 5,3 $\frac{0}{0}$
O_4 28,6 $\frac{0}{0}$	O_2 14,3 $\frac{0}{0}$
N_2 12,5 $\frac{0}{0}$	N_2 12,5 $\frac{0}{0}$
	S 14,3 $\frac{0}{0}$
<hr/> 100,0 $\frac{0}{0}$	<hr/> 100,0 $\frac{0}{0}$

ou avec le rapport **O : S = 3 : 2**

$C_6H_6O_5N_2$	$C_6H_6O_3N_2S$
C_6 38,7 $\frac{0}{0}$	C_6 38,7 $\frac{0}{0}$
H_6 3,2 $\frac{0}{0}$	H_6 3,2 $\frac{0}{0}$
O_5 43,0 $\frac{0}{0}$	O_3 25,8 $\frac{0}{0}$
N_2 15,1 $\frac{0}{0}$	N_2 15,1 $\frac{0}{0}$
	S 17,2 $\frac{0}{0}$
<hr/> 100,0 $\frac{0}{0}$	<hr/> 100,0 $\frac{0}{0}$

D'une manière analogue, les formules des tables **CHO** et **CHN**, pourront être appliquées pour le **Cl**, **Br**, **S** etc. autant qu'il ne s'agira que de valeurs approximatives. En effet, les rapports

$$\begin{aligned} O_5 : Br &= 80 : 80 \\ O_5 : Se &= 80 : 79 \\ O_8 : J &= 128 : 127 \\ N_5 : Cl_2 &= 70 : 71 \end{aligned}$$

atomiques et les compositions centésimales des combinaisons suivantes correspondent presque rigoureusement:

C_5H_9Br	wie	$C_5H_9O_5$
$C_8H_{10}Se$	„	$C_8H_{10}O_5$
$C_{10}H_{15}J$	„	$C_{10}H_{14}O_8$
$C_{12}H_{20}Cl_2$	„	$C_{12}H_{21}N_5$

Les erreurs d'analyse ne dépasseront pas $\frac{1}{10}$ — $\frac{3}{10}$ pour cent. Les compositions

Con ciò riesce pure evidente la ragione per cui nelle tabelle trovansi anche le percentuali dell'ossigeno, che a prima vista potrebbero sembrare inutili; ciò fu fatto per facilitare i calcoli relativi ai composti solforati.

Dai valori delle forme **CHON** si possono inoltre calcolare molto semplicemente quelli relativi alla forme **CHONS**; basta per ciò ripartire la percentuale dell'ossigeno secondo il rapporto tra ossigeno e solfo; per esempio:

Rapporto **O : S = 1 : 1**

In modo uguale, quando non si esigano che valori approssimativi, si possono impiegare le tavole delle forme **CHO** e **CHN** pel calcolo delle percentuali relative alle forme contenenti **Cl**, **Br**, **S** etc. Esistono infatti i seguenti rapporti:

ed i composti seguenti si corrispondono nelle loro percentuali.

La corrispondenza non è veramente esatta; essa però non presenta per lo più che

ständlichen Abweichung von $\frac{1}{10}$ bis höchstens $\frac{3}{10}$ Procent. Dass auch die procentuale Zusammensetzung hochmolekularer Formeln, sofern sie Multipla vorhandener Formeln sind, z. B.:

ohne Weiteres abgelesen werden kann, bedarf wohl nicht besonderer Erklärung. Den Rechnungen sind zu Grunde gelegt die abgerundeten Atomgewichte:

$$C = 12$$

$$H = 1$$

perimental errors which amount to 1—3 tenths of a per cent. It need not be mentioned that also the percentage compositions of polymeric compounds may be read off at sight, e. g.:

The calculations are based on the round numbers of the atomic weights:

$$O = 16$$

$$N = 14$$

Non occorre poi una speciale spiegazione per intendere che la composizione centesimale di forme molecolari molto complesse può senz'altro esser dedotta, purchè le forme ricercate siano multiple di qualche forma già calcolata; p. es:
